

Automatic Patching Line – for intelligent and sustainable manufacturing

Patching is one of the most effective ways of repairing various defects in birch veneers, such as holes and knots. An automatic patching line increases work efficiency and saves resources, thus supporting sustainable production, as well as minimises human resource input.

Precise and qualitative result. Wise use of raw materials and energy resources

Various sizes and shapes of butterfly type patching heads enhance the quality of the end product by precisely fixing defects and scanning veneers with laser technologies, and avoiding human errors.

- Patching heads in multiple sizes and shapes
- Strong patch that holds in place
- Quality control using intelligent laser technologies
- High precision and increased production speed
- Optimised raw material consumption
- Enhanced energy efficiency in manufacturing
- Increasing capacity of supplying high quality panels without open defects on face veneers and inner layers

Multiple sizes and shapes
